

ASP DOI – ASSIGNMENT GUIDELINES

The objective of this assignment is to verify your capability of applying theoretical concepts to interpret phenomena associated to innovation by applying them on a specific real domain (i.e., a real industrial sector).

FORMAT GUIDELINES

Your assignment will be a paper of 6,000 - 8,000 characters, spaces included. The structure of the paper should follow the typical structure of scientific papers (abstract, introduction, background/literature, ...). The title of your assignment will be:

TITLE: Application of the **X** to the study of industrial sector of **Y** focusing on a company (or set of companies) of your choice within the selected industry.

Where **X** and **Y** are determined as follows:

X represents one of the theoretical frameworks you have learnt during the DOI school:

- A** – Linear Model of Innovation
- B** – Abernathy-Utterback Model
- C** – Roger's Market Segments
- D** – Business Model Canvas
- E** – Intellectual Property Strategies (not limited to patents only)

Y represents the industrial sector you have been assigned to:

1 – Reusable & Edible Packaging: this sector is within the growing sustainable packaging industry, which has experienced a fast-paced growth rate (either in attention or sales) over the last years. This segment consists of companies developing reusable, compostable, or edible packaging solutions aimed at reducing single-use waste and improving circularity across food, beverage, and (general) consumer goods. These solutions are gaining attention due to increasing environmental awareness, stricter regulations on plastic waste, and growing consumer demand for sustainable, innovative, and

convenient alternatives to traditional packaging. Students dealing with this sector, can pick their preferred reference industry (e.g., food & beverage) while developing the paper.

2 – Alternative Proteins: this technological domain refers to the growing food-tech and sustainable food industry. We refer to companies developing non-conventional protein sources designed to replace or complement traditional animal-based proteins. Examples can be: plant-based proteins (e.g., pea, soy, and wheat-based meat and dairy alternatives), cultured meat produced through cellular agriculture, and fermentation-based proteins such as precision fermentation and mycoproteins. The rising global protein demand, paired with the lack of supplying enough traditional meat-based proteins, environmental concerns related to livestock farming, animal welfare considerations, and advancements in biotechnology are improving taste, texture, and scalability, hence generating interest around these technologies.

3 – Smart Clothing: this is part of the fast-growing wearable technology industry and smart textiles industry. Connected or sensor-enabled garments, capable of monitoring body conditions, adapting to environmental changes, or enhancing user comfort and performance, are getting rising interest across several industries. Applications range from healthcare and sports to fashion, workplace safety, and military use. These solutions are becoming more diffused due to advances in wearable sensors, IoT integration, and increasing demand for personalized, functional, and data-driven apparel. For the sake of simplicity, students dealing with this sector, can pick their preferred reference industry (e.g., sports) while developing the paper.

4 – Innovative Construction Materials: this domain refers to the sustainable construction and advanced materials industry. Companies in the construction industry are developing alternative building materials designed to improve sustainability, energy efficiency, durability, and construction performance compared to traditional concrete or brick-based solutions. Examples include hempcrete (hemp-based bricks), self-healing concrete, recycled plastic composites, mycelium-based insulation materials, aerogels, carbon-negative cement, and phase-change materials for thermal regulation. These solutions are gaining attention due to stricter environmental regulations, the need to reduce carbon emissions in the construction sector, and growing demand for circular and energy-efficient buildings.

CONTENT GUIDELINES

Students must use the following outline:

- 1 - Summary of the theoretical framework **X** (*around 10-15% of the paper*)
- 2 - Short description of the industrial sector **Y** (*around 15-20% of the paper*)
- 3 – Application of the theoretical framework **X** to the industrial sector **Y**, with author's original contribution in the analysis and discussion (*around 65-70% of the paper*)

REFERENCES

Students are required to find relevant sources and list them in a bibliography (not to be included in the character count). Direct quotations from journal articles, books, internet pages, and other references must be properly acknowledged in the paper, by **highlighting** the related citations with brackets or using italic text format. It is highly recommended to report the relevant ideas and concepts of such references by **summarizing** or **rephrasing** them. Finally, when referring to lectures given in this summer school, **do not cite** them in the bibliography.

In reporting information from the references, consider that each paper will undergo an **anti-plagiarism check** through a specific software to control for massive cut-and-paste and un-original works.

SUGGESTED REFERENCES:

- Hint: choose a company for which information may be available (e.g. publicly listed, or venture-backed and listed in Crunchbase and similar).
- Scientific articles from publication databases (Google Scholar, Scopus, Web of Science, etc.)
- Generalist professional magazines (Businessweek, Fortune, etc.)
- Focused professional magazines (Technology Review, Fast Company, etc.)
- Analyst reports (Gartner, Forrester, Frost&Sullivan, etc.)
- Specialized websites (Techcrunch, Engadget, etc.)
- Information that companies show on their corporate websites (corporate history, press releases, investor relations, etc.)
- Specific information contained in patent databases (Patent Inspiration, Espacenet, Google Patents, Lens.org, etc.)
- Speeches given by company founders at events (TED Talks, etc.)

STUDENTS – THEORY/SECTOR ASSIGNMENTS

SURNAME	NAME	THEORETICAL FRAMEWORK	INDUSTRY
ALIZERI	FABIO	Intellectual Property Strategies	Reusable & Edible Packaging
AVARO	GIORGIA	Roger's Market Segments	Innovative Construction Materials
BARBERO	GABRIELE	Business Model Canvas	Alternative Proteins
BERGA	MATTEO	Intellectual Property Strategies	Innovative Construction Materials
BONADA	GRETA	Intellectual Property Strategies	Smart Clothing
BORGIO	DAVIDE	Roger's Market Segments	Alternative Proteins
BRANDOLINI	MARCO	Abernathy-Utterback Model	Smart Clothing
CALCAGNO	LUCA	Roger's Market Segments	Alternative Proteins
CANNAVO'	SAMUELE	Roger's Market Segments	Reusable & Edible Packaging
CASINI	MATTEO	Linear Model of Innovation	Reusable & Edible Packaging
CESCHINI	ANNA	Linear Model of Innovation	Innovative Construction Materials
CHEBAN	DIANA GIULIA	Intellectual Property Strategies	Innovative Construction Materials
CICCONE	EMANUELE	Abernathy-Utterback Model	Smart Clothing
CORDONE	CLARA	Roger's Market Segments	Alternative Proteins
CORSINO	LORENZO	Linear Model of Innovation	Alternative Proteins
DI BONA	GIULIA	Linear Model of Innovation	Smart Clothing
DIODA	FRANCESCO	Business Model Canvas	Innovative Construction Materials
EPINEY	LISA	Linear Model of Innovation	Innovative Construction Materials
GHASEMI	FATEMEH	Intellectual Property Strategies	Reusable & Edible Packaging
GIUNTA	GIULIA	Intellectual Property Strategies	Reusable & Edible Packaging
GRIECO NOBILE	MATTEO	Linear Model of Innovation	Innovative Construction Materials
GUERRATO	ALBERTO	Roger's Market Segments	Reusable & Edible Packaging
HABIL	NATAL	Roger's Market Segments	Smart Clothing
INDIANO	GIOVANNI	Abernathy-Utterback Model	Smart Clothing
