

Weakness 1: the consistency is not respected in several points.

- Some features appear in the scenarios without being presented earlier (e.g., video call in the selection process, possibility to refuse contracts and propose new ones), while other information described in the phenomena is not included in the scenarios (e.g., selection process feedback).
- Some features are missing in the subsequent parts (e.g., no recommendation system in the domain class diagram, no video call in the state diagrams related to the selection process).

Weakness 2: precision and pertinence not respected in the domain class and state diagram.

- Correctness issues in the relationships of the domain class diagram (e.g., the relationships Experience-CV, Attitude-CV and Task-Contract are compositions, since the contained elements exist only within the container; the Task-Contract relationship is in the opposite direction).
- Some attributes and features have been added without being explained in the phenomena or scenarios, or without being useful to them (e.g., attributes profilePicture, locations, allowedDomains, capacity; In the state diagram “ongoing internship” it is stated that the university must contact the company or the student involved in a complaint).

Weakness 3: there are some problems regarding the unambiguity target quality.

- Lack of clarity in product functions, where many ambiguous synonyms are used and refer to functionalities that are not implemented in practice (e.g., “students can track their progress”, “companies can monitor performance”, “the new ratings will contribute to the average rating”).
- The structure of the scenarios is incorrect, as they refer to the system interface (e.g., button, icon, tab), and specific, not general, examples are used.
